Project 1-Problem 1

Program CalendarP1

Program Description: This program takes in inputs (month, day, and year) from the user and returns certain outputs such as a calendar, dates, day of the week, depending on what the user wants to be outputted.

Use of the program: The data he/she must have ready for inputs are the year (ex. "2016"), month number (1-12), and a day of the month. If the user choses to find the date after a given date, then they will need another number. No input files are needed for this program. The program displays a calendar of a certain month in addition to the date, and or day of the week depending on if the user wants that to show.

Bugs: None.
