Project 1-Problem 2

### **Program RmvTexP1**

**Program Description:** This program takes the item input (file name) on the command line to read a Tex file and convert some limited cases of \*.tex files to plain text \*.txt. The program removes command backslashes followed by one or more lowercase letters, braces, substitutes math formulas (characters in between "\$") by words FORMULA 1,2,3..... And puts everything between backlashed items in a new paragraph with a number.

**Use of the program:** The user needs a Tex file and has to save it in the same directory as this program. The output should be a new text file with the same name as the tex file, which is updated with the conversions the program has done.

**Bugs:** None.
