Project 2-Problem 1

Program ComputeGradesP2

Program Description: This program takes input files, one containing students first and last name in addition to their test or exam scores. Then the program calculates/ finds and prints out into an output file as well as shown on the client; the first and last name, each student average score, letter grade of that, and the rubrics' they did best in.

Use of the program: The user needs to have files for the students/scores and rubrics ready as listed above. It'd be recommended to use "projA.txt" and "projA-rub.txt", but is not required. User will then be prompted to type in the name if each file. The program then shows the statistics based off the files as listed above in the description. And Prints the statistics in to an output file names "output.txt".

Bugs: None, so far, if any please report to my email @ allynvo@yahoo.com. Thanks.
