Project 3

Program AmountDueP3

Program Description: This program opens a window for the user to select certain services an automotive business would have in addition to inputting extra labor hours if needed. The program then can calculate the charges (standard service fees, labor fees, total, taxes, and overall amount due) and inputs it out into a new window to see.

Use of the program: The program is meant for an "automotive business". The user just needs to know which services to select and number of extra hours to input so that the program can calculate the charges. However, if there is no need to add extra labor hours then the user should input the number "0" (Zero) into the labor text field. The program then shows all the charges in a new window after pressing the calculate button. The main client that needs to be run is "AmountDueP3".

Bugs: None.
